

CSS Box Model

- In the CSS box model, every HTML element is treated as a box with four areas.
- Imagine you receive a box from your favorite online retailer -- the content is the item in the box, or in our case, a header, paragraph, or image.

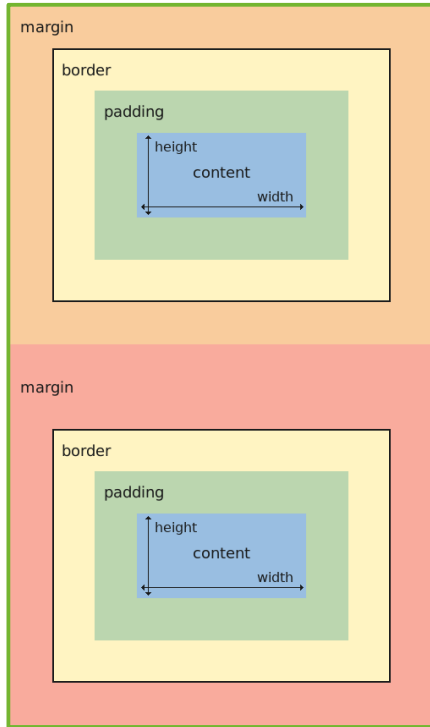

CSS Box Model

- The content is surrounded by a space called padding, similar to how bubble wrap separates an item from the box around it.
- Think of the border like the cardboard box your item was shipped in.

CSS Box Model

- Margin is the area outside of the box, and can be used to control the space between other boxes or elements.
- Here the bottom element has a larger top margin, pushing it further down the page.
